P631: Accelerating opposition analysis in professional rugby

Past fortnight

Over the past fortnight, the Team has focused on preparing for the beginning of P631 and developing a better understanding of the project and its industry context.

We worked together on our Introduction to our Industry Partner, contributing information about our individual backgrounds, skills, interests, strengths and development goals. The Team reviewed the document together to ensure that the information was accurate, consistent, and aligned with the QUT requirements before finalising it.

Following our allocation to P631, Team members also reviewed the project description and carried out initial research into the Queensland Reds, rugby, opposition analysis and the purpose of the project. This helped us develop a shared understanding that the project is focused on streamlining the existing opposition-analysis workflow and reducing repetitive manual work through software engineering and automation.

These early activities have helped the Team understand the project context, recognise how our different skills may contribute, and identify areas that will need to be clarified with the Industry Partner before we make detailed decisions about the solution.

We also participated in Team meetings and discussions to coordinate tasks, review documentation, and identify questions that need to be clarified with the Industry Partner. These activities established a foundation for moving from team formation into project discovery.

Fortnight ahead

Our next priority is to move from initial preparation into stakeholder engagement and project discovery.

We are preparing for our first meeting with the Industry Partner, subject to meeting arrangements being confirmed. Before the meeting, we plan to continue developing our understanding of the project and prepare questions about the current opposition-analysis workflow, including the data sources, analytical components, reporting process, stakeholder needs and areas where repetitive or inefficient work may occur.

During the Industry Partner discussion, we aim to gather information that will help us understand the current process and identify possible opportunities for automation without making assumptions about the final solution too early.

Following the meeting, the Team plans to meet again to review what we have learned, document important requirements and feedback, discuss any new questions or uncertainties, and agree on our next steps. As our understanding develops, we aim to begin defining a realistic scope for Phase 1 and identifying which areas of the workflow should be investigated further.

To discuss

We would value feedback on the following areas:

- Industry Partner meeting: What should we prioritise in our first meeting with the Industry Partner to make sure we gather the most useful information for the project?
- Project discovery: By the next Tutor meeting, what level of understanding of the current opposition-analysis workflow and stakeholder requirements should we aim to demonstrate?
- Phase 1 scope: At what point should we begin narrowing the project scope and identifying specific automation opportunities?
- Early project work: Before the project scope is confirmed, what types of analysis, documentation or artefacts would be most useful for demonstrating meaningful progress?
- How will the Industry Partner contact our Team? Will they communicate through one nominated Team representative, or contact all Team members directly?

a. Kelvin Dang (n12051632)

My work

Over the past fortnight, I mainly focused on building a better understanding of the project, the rugby context, and the organisation we are working with, while also contributing to Team discussions and documentation.

Since rugby was still quite unfamiliar to me, I spent some time learning the basic rules, terminology and general match structure. I have always been interested in sport, especially football, so I felt that having a basic understanding of rugby would help me follow future discussions with analysts and stakeholders more easily and better understand the purpose of the analyses involved in the project.

I also researched the **Queensland Reds and Queensland Rugby Union** to understand the organisation and the professional high-performance environment in which the project will be used. This helped me recognise that our solution should not only work technically, but should also be practical, reliable and suitable for a real analysis workflow.

Another main part of my work was reviewing **P631: Accelerating opposition analysis in professional rugby** to understand the project goals and expected deliverables. My current understanding is that the main objective is not to create new rugby analysis methods, but to reduce repetitive manual work by automating the workflow from data collection and analytical scripts to consolidated reporting.

From this, I also started to form an overall picture of the end-to-end workflow that the Team may need to investigate, including data sources, processing steps, existing scripts or Jupyter notebooks, and final outputs for analysts and coaches. This also helped me identify areas that still need to be clarified with the Industry Partner before the Team makes detailed technical decisions.

In addition, I participated in Team meetings and discussions, shared my understanding and questions about the project, and reviewed some Team documents by suggesting small edits or changes where the wording or ideas could be clearer.

My plans

Over the next fortnight, I plan to focus more on understanding how the current opposition-analysis workflow actually works in practice. As we have more discussions with the

Industry Partner, I want to clarify how the different data sources, analytical scripts or notebooks, and reporting steps are connected, as well as where the main repetitive or inefficient parts of the current process are.

At the same time, I plan to start looking into possible approaches for automating and orchestrating this workflow. My aim is not to decide on a technology too early, but to understand what kind of solution would be suitable for integrating existing analytical components while remaining configurable, maintainable and easy to extend in the future.

I will also continue contributing to Team meetings, discussions and documentation, especially by helping turn what we learn from stakeholders into clearer requirements, questions and next steps. By the next tutor meeting, I hope to have a more concrete understanding of the current workflow and a clearer idea of what the Team should investigate or prototype next.

b. Leon Duong (n11849789)

My work

Over the past fortnight, I focused on learning more about our project, P631, and understanding what the project is trying to achieve. As I did not have much knowledge about rugby before starting this project, I spent some time researching the basic rules, positions and terminology to help me understand the project better.

I also did some basic research into opposition analysis and how it can be used by coaches and analysts to prepare for matches. This helped me understand why the project is focused on making the analysis process easier and reducing repetitive manual work.

I helped prepare and submit our Team Intro for P631: Accelerating Opposition Analysis in Professional Rugby. I also participated in Team meetings and discussions, shared my ideas and questions, and worked with the other team members to improve my understanding of the project.

My plan

Over the next fortnight, I plan to continue learning about rugby and understand more about how opposition analysis works in practice. I also want to learn more about the current analysis process and identify areas that could potentially be improved or automated.

I will continue contributing to Team meetings and discussions and complete my assigned tasks. My main goal is to build my knowledge of the project and make a useful contribution to the Team.

c. Nao Hakoda (n11917580)

My work

Over the past fortnight, I focused on submission of the team intro to the industry partner, and the research about our industry partner and project, P631: Accelerating Opposition Analysis in Professional Rugby.
In the team intro, I contributed to writing “Our commitments to this Capstone Project”, my individual section, and my strengths.

I also attended the meeting with my team. During that meeting, our team reviewed our team’s intro to make sure every section was written correctly and there’s no wrong information about our information because if there is, our partner can misunderstand us, so we checked our document carefully.

I didn’t know much about our partner and sports, so I did a little research. That led to more understanding and because of that research it is easier to imagine our project.

Additionally, I completed the SCIP agreements

My plans

In the next fortnight, I will continue to research about our partner to get to know more deeply, so I might be able to use this information in the future project.

I also want to focus on document work if there is. This information can be very important, like team intro, so I want to make sure all team members contribute to this task and work collaboratively.

My team will do the meetings to discuss progress, divide tasks, and address any issues. I will attend these meetings to make sure our team aligns with the project goals with my teammates.

Before the meeting with the industry partner, I will understand their needs and the project. And prepare questions that we are not clear, so we can carry out the meeting smoothly.

In addition, I will keep studying my interests and strengths that I might use for this project. And make sure to review project’s essential skills, so I can easily understand other member’s task, and it can lead to steady progress

d. Star Kamonthitiwuth (n11864133)

My work

Over the past fortnight, I have mainly contributed to the team's early coordination, project preparation and documentation.

At the beginning of the fortnight, I helped organise a suitable meeting time for the team so that we could work together on our introduction to our tutor. I have also been keeping track of project updates and reminding the team about important tasks and the next steps we need to complete each week. This has helped us stay aware of what needs to be done and encouraged everyone to contribute before key documents are finalised.

Before project allocation, I contributed to reviewing the available project options and discussing our preferences based on the team's combined skills and interests. After we were allocated P631: Accelerating opposition analysis in professional rugby, I reviewed the project information in more detail to understand its overall purpose, expected outcomes and the type of work that may be involved.

I also contributed substantially to our Team Intro to our industry partner. I worked on several sections of the document and helped organise and refine information about our team's skills, interests, strengths and goals. I reviewed the document against the QUT instructions, including its content, placeholders, formatting and instructional text that needed to be removed. I also communicated with other team members and encouraged everyone to review or edit the document so that the final content reflected the team rather than only a small number of members.

These activities have helped me develop a clearer understanding of both our team's capabilities and the project before we begin more detailed discussions with our industry partner.

My plan

Over the next fortnight, I plan to prepare for and actively participate in our first meeting with the industry partner. I want to develop a clearer understanding of the current opposition-analysis workflow, including how coaches and analysts currently work with different data sources and analytical components, and where repetitive or inefficient tasks occur.

During the meeting, I plan to help gather and document important requirements, expectations, constraints and feedback from the industry partner. As we learn more about the existing process, I would also like to contribute to identifying potential opportunities for automation and help the team define a realistic scope for phase 1.

I want to understand the problem and stakeholder needs before making assumptions about the final technical solution, particularly because the project allows teams to explore different software architectures, automation strategies and user experiences.

Once the project direction becomes clearer, I would like to contribute in areas that align with my skills, particularly business analysis, UX/UI design and database design. If the proposed solution involves a user-facing interface, data organisation or database component, I would be interested in contributing to its design and development.

By the next tutor meeting, I hope to have a clearer understanding of the industry partner's needs, the existing workflow, the initial project scope and where I can contribute most effectively.

e. Ngoc Ha Nguyen (n12248746)

My work

Over the past fortnight, I contributed to the preparation and submission of our Team Intro for P631: Accelerating Opposition Analysis in Professional Rugby.

I provided information about my academic background, skills, interests, and development goals. In particular, I identified report writing, visual design, and Power BI as my main strengths. This helped the Team understand how I could contribute to areas such as data reporting, visualisation and the presentation of analytical results.

I also helped write the "Our ambitions for growth, learning and development" section. I contributed to explaining what each Team member hopes to learn from the project and how our different development goals can support the creation of one coherent product. For my own development, I identified that I want to improve my ability to transform complex or unstructured data into clear information that coaches and analysts can understand and use. This was relevant because P631 requires the Team to combine technical components with useful and accessible reporting.

After the document was completed, I reviewed the full version before submission. I checked that the required sections were included, the information about each member was complete and consistent. I also checked its wording, structure and overall presentation. This review helped improve the accuracy and professionalism of the document. Once the Team confirmed the final version, I submitted the file on behalf of the Team. This ensured that the correct version was submitted by the deadline

I also reviewed the P631 project description to understand its objectives and expected deliverables. From this review, I identified that the project involves integrating multiple data sources, executing existing scripts and Jupyter notebooks, and generating consolidated reports. This gave me a clearer understanding of how my reporting and visualisation skills could support the project.

My plans

Over the next fortnight, I plan to focus on project discovery, stakeholder requirements, and reporting needs.

Before meeting with the Queensland Rugby Union, I will prepare questions about the current analysis workflow, including the data sources used, the existing analytical components and the

reports currently provided to coaches. This information will help the Team identify suitable automation opportunities without making unsupported assumptions.

During stakeholder discussions, I plan to help record important information about the current process, user needs, and reporting expectations. I will then help organise the findings and communicate them to the Team so that we can define a realistic project scope and prioritise the most valuable parts of the workflow.

Using my interest in data analysis and Power BI, I will investigate how the outputs of the analytical components could be presented clearly to coaches and analysts. I will first focus on understanding what information users need before proposing a dashboard or report design. I will also support the Team in documenting requirements, decisions and progress so that our work can be understood and extended by future project teams.
